My Own String Comparer

- use the charAt(int i) method of String

- use the fact that you can cast a char to an int (and get the ASCII value)

- so (int)"abc".charAt(0)

  - == 97, the ASCII value of 'a'

Comparison results

Compare abc to def: -3

Compare zyx to xyz: 2

Compare A to a: -32

Compare abc to a: 2

Compare abcd to abcdefg: -3

Compare bbb to a: 1

Comparison Code

```java
public int myCompareTo(String st1, String st2) {
        int len1 = st1.length();
        int len2 = st2.length();
        if (len1!=len2) {
            return len1-len2;
        }
        for (int i=0; i<len1; i++) {
            int diff = st1.charAt(i)-
st2.charAt(i);
            if (diff!=0)
                return diff;
        }
        return 0;
    }
```

To keep in sorted order

- Figure out where something should be put

- put it there

Draw Algorithms

Time Complexity

- Find location
    - on average
        - N/2 comparisons
        - N/2 adds
        - N/2 sets
            - so 3N/2
    - worst case 3N
    - O(n)
- Make a space
    - Same on average and worst cases
    - O(n)
- Overall
    - On average we have 3N/2 + 3N/2 = 6N/2 = 3N
    - Note worst case for find is best case for insert so we have 3N+1
    - Any way we count O(n) for adding **one** item
-

Code it Out

Sal.java

SAL looks a lot like ArrayList

- Should / can "extend ArrayList"
- Can — yes
- Should — almost certainly
- Why NOT?
  - I already have something working
    - lame
  - ArrayList provides lots of functions I do not want to give my users
    - reasonable (possibly)
