Probability Trees and the Multiplication Rule

CS231 Dianna Xu

The multiplication rule

- · Also called the product rule
- If there are n₁ ways to do task 1, and n₂ ways to do task 2
 - Then there are $n_1 \mathbf{x} n_2$ ways to do both tasks in sequence
 - We must make one choice AND a second choice

Product rule example

- Sample question
 - There are 18 MATH majors and 17 CS majors
 - How many ways are there to pick one math major and one CS major?

3

5

• Total is 17 x 18 = 306

Product rule example How many strings of 4 decimal digits...

- Do not contain the same digit twice?
 We want to chose a digit, then another that is not the same, then another...
 - First digit: 10 possibilities
 - Second digit: 9 possibilities (all but first digit)
 Third digit: 8 possibilities
 - Fourth digit: 7 possibilities
 - Total = 10x9x8x7 = 5040
- End with an even digit?
- First three digits have 10 possibilities
- Last digit has 5 possibilities
- Total = 10x10x10x5 = 5000

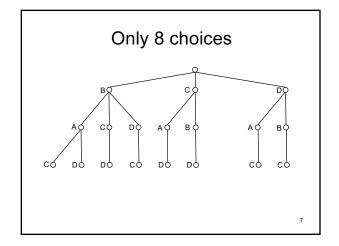

When the product rule is difficult to apply

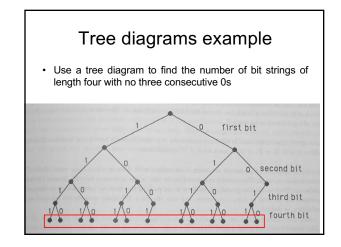

- President, treasurer and secretary are to be chosen among A, B, C, D. A can not be president and either C or D must be secretary.
- Naïve application of the product rule:
 - President: 3
 - Treasurer: 3
 - Secretary: 2
 - Total = 18

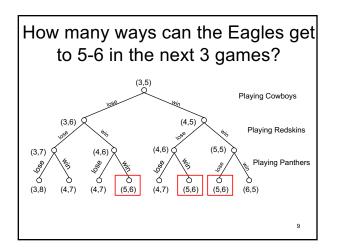

Tree diagrams

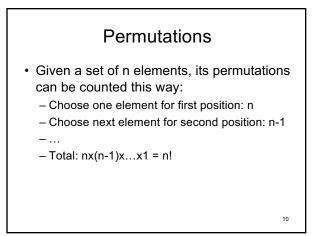

- We can use tree diagrams to enumerate the possible choices
- Once the tree is laid out, the result is the number of (valid) leaves

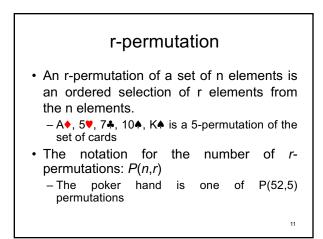

6

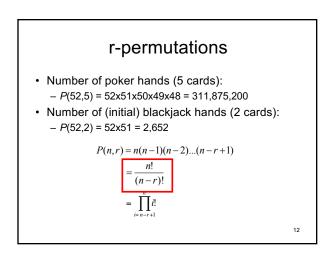

r-permutation Formula

• There are *n* ways to choose the first element

13

15

- -n-1 ways to choose the second
- n-2 ways to choose the third

- ...

- -n-r+1 ways to choose the r^{th} element
- By the product rule, that gives us: *P*(*n*,*r*) = *n*(*n*-1)(*n*-2)...(*n*-*r*+1)

r-permutations example

- How many ways are there for 3 students in this class to sit together?
- There are 50 students in the class
 P(50,3) = 50x49x48 = 117,600
 - Note that the positions they take do matter

Permutations vs. *r*-permutations *r*-permutations: Choosing an ordered 5 card hand is *P*(52,5) When people say "permutations", they almost always mean *r*-permutations

- But the name can refer to both
- Permutations: Choosing an order for all 52 cards is *P*(52,52) = 52!
 - Thus, P(n,n) = n!

Sample question How many permutations of {a, b, c, d, e, f, g} end with a? Note that the set has 7 elements The last character must be a The rest can be in any order Thus, we want a 6-permutation on the set {b, c, d, e, f, g}

- P(6,6) = 6! = 720
- Why is it not P(7,6)?
